## $650 \mathrm{kHz} / 1.2 \mathrm{MHz}$, 18.5 V STEP-UP DC-DC CONVERTER

## FEATURES

- 2.3 V to 6 V Input Voltage Range
- 18.5 V Boost Converter With 2.0 A Switch Current
- 650 kHz/1.2 MHz Selectable Switching Frequency
- Adjustable Soft-Start
- Thermal Shutdown
- Undervoltage Lockout
- 8-Pin MSOP Package
- 8-Pin TSSOP Package

## DESCRIPTION

The TPS61085 is a high frequency, high efficiency DC to DC converter with an integrated $2.0 \mathrm{~A}, 0.13 \Omega$ power switch capable of providing an output voltage up to 18.5 V . The selectable frequency of 650 kHz and 1.2 MHz allows the use of small external inductors and capacitors and provides fast transient response. The external compensation allows optimizing the application for specific conditions. A capacitor connected to the soft-start pin minimizes inrush current at startup.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ORDERING INFORMATION ${ }^{(1)(2)}$

| $\mathbf{T}_{\mathbf{A}}$ | ORDERING | PACKAGE | PACKAGE MARKING |
| :---: | :---: | :---: | :---: |
| -40 to $85^{\circ} \mathrm{C}$ | TPS61085DGK | MSOP-8 (DGK) | PMKI |
| -40 to $85^{\circ} \mathrm{C}$ | TPS61085PW | TSSOP-8 (PW) | 61085 |

(1) The DGK and PW packages are available taped and reeled.
(2) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI website at www.ti.com.

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  | VALUE | UNIT |
| :--- | :---: | :---: |
| Input voltage range IN $^{(2)}$ | -0.3 to 7 | V |
| Voltage range on pins EN, FB, SS, FREQ, COMP | -0.3 to 7 | V |
| Voltage on pin SW | 20 | V |
| ESD rating HBM | 2 | kV |
| ESD rating MM | 200 | V |
| ESD rating CDM | 500 | V |
| Continuous power dissipation | See Dissipation Rating Table |  |
| Operating junction temperature range | -40 to 150 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature range | -65 to 150 | ${ }^{\circ} \mathrm{C}$ |
| Lead temperature (soldering, 10 sec) | 260 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability
(2) All voltage values are with respect to network ground terminal.

## DETAILED DESCRIPTION

Figure 11. Block Diagram
The boost converter is designed for output voltages up to 18.5 V with a switch peak current limit of 2.0 A minimum. The device, which operates in a current mode scheme with quasi-constant frequency, is externally compensated for maximum flexibility and stability. The switching frequency is selectable between 650 kHz and 1.2 MHz and the minimum input voltage is 2.3 V . To control the inrush current at start-up a soft-start pin is available.
During the on-time, the voltage across the inductor causes the current in it to rise. When the current reaches a threshold value set by the internal GM amplifier, the power transistor is turned off, the energy stored into the inductor is then released and the current flows through the Schottky diode towards the output of the boost converter. The off-time is fixed for a certain $\mathrm{V}_{\mathbb{I}}$ and $\mathrm{V}_{\mathrm{S}}$, and therefore maintains the same frequency when varying these parameters.
However, for different output loads, the frequency may slightly change due to the voltage drop across the Rdson of the power transistor which will have an effect on the voltage across the inductor and thus on $\mathrm{t}_{\mathrm{ON}}$ ( $\mathrm{t}_{\mathrm{OFF}}$ remains fixed). Some slight frequency changes might also appear with a fixed output load due to the fact that the output voltage $\mathrm{V}_{\mathrm{S}}$ is not sensed directly but via the SW Pin, which affects accuracy.
Because of the quasi-constant frequency behavior of the device, the TPS61085 eliminates the need for an internal oscillator and slope compensation, which provides better stability for the system over a wide of input and output voltages range, and more stable and accurate current limiting operation compared to boost converters operating with a conventional PWM scheme. The TPS61085 topology has also the benefits of providing very good load and line regulations, and excellent load transient response.

## Design Procedure

The first step in the design procedure is to verify that the maximum possible output current of the boost converter supports the specific application requirements. A simple approach is to estimate the converter efficiency, by taking the efficiency numbers from the provided efficiency curves or to use a worst case assumption for the expected efficiency, e.g. 90\%.

1. Duty Cycle:

$$
D=1-\frac{V_{I N} \times \eta}{V S}
$$

2. Maximum output current:

$$
\text { Iout }=\left(I_{\text {swpeak }}-\frac{\Delta I_{L}}{2}\right) \times(1-D)
$$

$$
I_{\text {swpeak }}=\frac{\Delta I_{L}}{2}+\frac{I_{\text {out }}}{1-D}
$$

with $\Delta I_{L}=\frac{V_{I N} \times D}{f_{s \times L}}$
and
$I_{\text {swpeak }}=$ converter switch current (minimum switch current limit $=2.0 \mathrm{~A}$ )
fs = Converter switching frequency (typically 1.2 MHz )
$\mathrm{L}=$ Selected inductor value
$\eta=$ Estimated converter efficiency (please use the number from the efficiency plots or $90 \%$ as an estimation)
$\Delta L_{L}=$ Inductor peak-to-peak ripple current
The peak switch current is the steady state peak switch current that the integrated switch, inductor and external Schottky diode has to be able to handle. The calculation must be done for the minimum input voltage where the peak switch current is the highest.

## Soft-start

The boost converter has an adjustable soft-start to prevent high inrush current during start-up. To minimize the inrush current during start-up an external capacitor connected to the soft-start pin SS is used to slowly ramp up the internal current limit of the boost converter when charged with a constant current. When the EN pin is pulled high, the soft-start capacitor $\mathrm{C}_{S S}$ ) is immediately charged to 0.3 V . The capacitor is then charged at a constant current of $10 \mu \mathrm{~A}$ typically until the output of the boost converter $\mathrm{V}_{\mathrm{S}}$ has reached its Power Good threshold ( $90 \%$ of $\mathrm{V}_{\mathrm{S}}$ nominal value). During this time, the SS voltage directly controls the peak inductor current, starting with 0 A at $\mathrm{V}_{S S}=0.3 \mathrm{~V}$ up to the full current limit at $\mathrm{V}_{\mathrm{SS}} \approx 800 \mathrm{mV}$. The maximum load current is available after the soft-start is completed. The larger the capacitor the slower the ramp of the current limit and the longer the soft-start time. A 100 nF capacitor is usually sufficient for most of the applications. When the EN pin is pulled low, the soft-start capacitor is discharged to ground.

## Inductor Selection

The TPS61085 is designed to work with a wide range of inductors. The main parameter for the inductor selection is the saturation current of the inductor which should be higher than the peak switch current as calculated in the Design Procedure section with additional margin to cover for heavy load transients. An alternative, more conservative, is to choose an inductor with a saturation current at least as high as the maximum switch current limit of 3.2 A. The other important parameter is the inductor dc resistance. Usually, the lower the dc resistance the higher the efficiency. It is important to note that the inductor dc resistance is not the only parameter determining the efficiency. Especially for a boost converter where the inductor is the energy storage element, the type and core material of the inductor influences the efficiency as well. At high switching frequencies of 1.2 MHz inductor core losses, proximity effects and skin effects become more important. Usually, an inductor with a larger form factor gives higher efficiency. The efficiency difference between different inductors can vary between $2 \%$ to $10 \%$. For the TPS61085, inductor values between $3 \mu \mathrm{H}$ and $6 \mu \mathrm{H}$ are a good choice with a switching frequency of 1.2 MHz , typically $3.3 \mu \mathrm{H}$. At 650 kHz we recommend inductors between $6 \mu \mathrm{H}$ and $13 \mu \mathrm{H}$, typically $6.8 \mu \mathrm{H}$. Possible inductors are shown in table 1.

Typically, it is recommended that the inductor current ripple is below $20 \%$ of the average inductor current. The following equation can therefore be used to calculate the inductor value:

$$
\begin{equation*}
\mathrm{L}=\left(\frac{\mathrm{VIN}_{\mathrm{IN}}}{\mathrm{Vs}}\right)^{2} \times\left(\frac{\mathrm{Vs}_{\mathrm{s}}-\mathrm{VIN}_{\text {IN }}}{\text { Iout_max } \times \mathrm{f}}\right) \times\left(\frac{\eta}{0.35}\right) \tag{1}
\end{equation*}
$$

Table 1. Inductor Selection

## Rectifier Diode Selection

To achieve high efficiency, a Schottky type should be used for the rectifier diode. The reverse voltage rating should be higher than the maximum output voltage of the converter. The averaged rectified forward current $\mathrm{l}_{\text {avg }}$, the Schottky diode needs to be rated for, is equal to the output current $\mathrm{I}_{\text {out }}$ :

$$
I_{\text {avg }}=I_{\text {out }}
$$

Usually a Schottky diode with 2 A maximum average rectified forward current rating is sufficient for most applications. The Schottky rectifier can be selected with lower forward current capability depending on the output current $\mathrm{I}_{\text {out }}$ but has to be able to dissipate the power. The dissipated power is the average rectified forward current times the diode forward voltage.

$$
P_{D}=I_{\text {avg }} \times V_{\text {forward }}
$$

Typically the diode should be able to dissipate around 500 mW depending on the load current and forward voltage.

Table 2. Rectifier Diode Selection

| CURRENT <br> RATING lavg | Vr | $\mathbf{V}_{\text {forward } / \text { lavg }}$ | SUPPLIER | COMPONENT <br> CODE | PACKAGE <br> TYPE |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 750 mA | 20 V | $0.425 \mathrm{~V} /$ <br> 750 mA | Fairchild Semiconductor | FYV0704S | SOT 23 |
| 1 A | 20 V | $0.39 \mathrm{~V} / 1 \mathrm{~A}$ | NXP | PMEG2010AEH | SOD 123 |
| 1 A | 20 V | $0.52 \mathrm{~V} / 1 \mathrm{~A}$ | Vishay Semiconductor | B120 | SMA |
| 1 A | 20 V | $0.5 \mathrm{~V} / 1 \mathrm{~A}$ | Vishay Semiconductor | SS12 | SMA |
| 1 A | 20 V | $0.44 \mathrm{~V} / 1 \mathrm{~A}$ | Vishay Semiconductor | MSS 1 P 2 L | $\mu$-SMP (Low <br> Profile) |

## Setting the Output Voltage

The output voltage is set by an external resistor divider. Typically, a minimum current of $50 \mu \mathrm{~A}$ flowing through the feedback divider gives good accuracy and noise covering. A standard low side resistor of $18 \mathrm{k} \Omega$ is typically selected. The resistors are then calculated as:

$$
\begin{equation*}
R 2=\frac{V r e f}{70 \mu A} \approx 18 k \Omega \quad R 1=R 2 \times\left(\frac{V S}{V r e f}-1\right) \tag{2}
\end{equation*}
$$

## Compensation (COMP)

The regulator loop can be compensated by adjusting the external components connected to the COMP pin. The COMP pin is the output of the internal transconductance error amplifier. Standard values of $\mathrm{R}_{\text {COMP }}=13 \mathrm{k} \Omega$ and $\mathrm{C}_{\text {COMP }}=3.3 \mathrm{nF}$ will work for the majority of the applications.
Please refer to Table 3 for dedicated compensation networks giving an improved load transient response. The following equations can be used to calculate $\mathrm{R}_{\text {COMP }}$ and $\mathrm{C}_{\text {Сомр }}$ :

$$
\begin{equation*}
\mathrm{R}_{\text {COMP }}=\frac{125 \times \text { Vin } \times \text { Vs } \times \text { Cout }}{\mathrm{L} \times \text { Iout_max }} \quad \mathrm{C}_{\mathrm{COMP}}=\frac{\mathrm{Vs} \times \text { Cout }}{5 \times \text { Iout_max } \times \mathrm{R}_{\mathrm{COMP}}} \tag{3}
\end{equation*}
$$

Table 3. Recommended Compensation Network Values at High/Low Frequency

| FREQUENCY | L | $\mathrm{V}_{\text {S }}$ | $\mathrm{V}_{\mathrm{IN}} \pm \mathbf{2 0 \%}$ | $\mathbf{R}_{\text {COMP }}$ | $\mathrm{C}_{\text {comp }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| High (1.2 MHz) | $3.3 \mu \mathrm{H}$ | 15 V | 5 V | $82 \mathrm{k} \Omega$ | 1.1 nF |
|  |  |  | 3.3 V | $75 \mathrm{k} \Omega$ | 1.6 nF |
|  |  | 12 V | 5 V | $51 \mathrm{k} \Omega$ | 1.1 nF |
|  |  |  | 3.3 V | $47 \mathrm{k} \Omega$ | 1.6 nF |
|  |  | 9 V | 5 V | $30 \mathrm{k} \Omega$ | 1.1 nF |
|  |  |  | 3.3 V | $27 \mathrm{k} \Omega$ | 1.6 nF |
| Low (650 kHz) | $6.8 \mu \mathrm{H}$ | 15 V | 5 V | $43 \mathrm{k} \Omega$ | 2.2 nF |
|  |  |  | 3.3 V | $39 \mathrm{k} \Omega$ | 3.3 nF |
|  |  | 12 V | 5 V | $27 \mathrm{k} \Omega$ | 2.2 nF |
|  |  |  | 3.3 V | $24 \mathrm{k} \Omega$ | 3.3 nF |
|  |  | 9 V | 5 V | $15 \mathrm{k} \Omega$ | 2.2 nF |
|  |  |  | 3.3 V | $13 \mathrm{k} \Omega$ | 3.3 nF |

Table 3 gives conservatives Rcomp and Comp values for certain inductors, input and output voltages providing a very stable system. For a faster response time, a higher Rcomp value can be used to enlarge the bandwidth, as well as a slightly lower value of Ccomp to keep enough phase margin. These adjustments should be performed in parallel with the load transient response monitoring of TPS61085.

## Input Capacitor Selection

For good input voltage filtering low ESR ceramic capacitors are recommended. TPS61085 has an analog input IN . Therefore, a $1 \mu \mathrm{~F}$ bypass is highly recommended as close as possible to the IC from IN to GND.
One $10 \mu \mathrm{~F}$ ceramic input capacitors are sufficient for most of the applications. For better input voltage filtering this value can be increased. Refer to table 4 and typical applications for input capacitor recommendations.

## Output Capacitor Selection

For best output voltage filtering a low ESR output capacitor like ceramic capcaitor is recommended. Two $10 \mu \mathrm{~F}$ ceramic output capacitors (or one $22 \mu \mathrm{~F}$ ) work for most of the applications. Higher capacitor values can be used to improve the load transient response. Refer to Table 4 for the selection of the output capacitor.

Table 4. Rectifier Input and Output Capacitor Selection

|  | CAPACITOR | VOLTAGE RATING | SUPPLIER | COMPONENT CODE |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{C}_{\mathrm{IN}}$ | $10 \mu \mathrm{~F} / 1206$ | 16 V | Taiyo Yuden | EMK212 BJ 106KG |
| IN bypass | $1 \mu \mathrm{~F} / 0603$ | 16 V | Taiyo Yuden | EMK107 BJ 105KA |
| $\mathrm{C}_{\text {OUT }}$ | $10 \mu \mathrm{~F} / 1206$ | 25 V | Taiyo Yuden | TMK316 BJ 106KL |

## Frequency Select Pin (FREQ)

The frequency select pin FREQ allows to set the switching frequency of the device to 650 kHz (FREQ = low) or 1.2 MHz (FREQ = high). Higher switching frequency improves load transient response but reduces slightly the efficiency. The other benefits of higher switching frequency are a lower output ripple voltage. Usually, it is recommended to use 1.2 MHz switching frequency unless light load efficiency is a major concern.

## Undervoltage Lockout (UVLO)

To avoid mis-operation of the device at low input voltages an undervoltage lockout is included that disables the device, if the input voltage falls below 2.2 V .

## Thermal Shutdown

A thermal shutdown is implemented to prevent damages due to excessive heat and power dissipation. Typically the thermal shutdown threshold is $150^{\circ} \mathrm{C}$. When the thermal shutdown is triggered the device stops switching until the temperature falls below typically $136^{\circ} \mathrm{C}$. Then the device starts switching again.

Figure 20. Simple Application (3.3V input - $\mathrm{f}_{\mathrm{sw}}=650 \mathrm{kHz}$ ) for wLED Supply (3S3P) with Adjustable Brightness Control using an Analog Signal on the Feedback Pin (with optional clamping Zener diode)

PACKAGE OPTION ADDENDUM

## PACKAGING INFORMATION

| Orderable Device | Status ${ }^{(1)}$ | Package Type | Package Drawing |  | Package Qty | $\text { e Eco Plan }{ }^{(2)}$ | Lead/Ball Finish | MSL Peak Temp ${ }^{(3)}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TPS61085DGKR | ACTIVE | MSOP | DGK | 8 | 2500 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085DGKRG4 | ACTIVE | MSOP | DGK | 8 | 2500 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085DGKT | ACTIVE | MSOP | DGK | 8 | 250 | $\begin{gathered} \text { Green (RoHS \& } \\ \text { no } \mathrm{Sb} / \mathrm{Br}) \end{gathered}$ | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085DGKTG4 | ACTIVE | MSOP | DGK | 8 | 250 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085PW | ACTIVE | TSSOP | PW | 8 | 150 | $\begin{gathered} \text { Green (RoHS \& } \\ \text { no } \mathrm{Sb} / \mathrm{Br}) \end{gathered}$ | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085PWG4 | ACTIVE | TSSOP | PW | 8 | 150 | $\begin{gathered} \text { Green (RoHS \& } \\ \text { no } \mathrm{Sb} / \mathrm{Br} \text { ) } \\ \hline \end{gathered}$ | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085PWR | ACTIVE | TSSOP | PW | 8 | 2000 | Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) | CU NIPDAU | Level-1-260C-UNLIM |
| TPS61085PWRG4 | ACTIVE | TSSOP | PW | 8 | 2000 | $\begin{gathered} \text { Green (RoHS \& } \\ \text { no Sb/Br) } \end{gathered}$ | CU NIPDAU | Level-1-260C-UNLIM |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS \& no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The $\mathrm{Pb}-\mathrm{Free} / \mathrm{Green}$ conversion plan has not been defined.
Pb -Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, Tl Pb -Free products are suitable for use in specified lead-free processes.
Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb - Free (RoHS compatible) as defined above.
Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine ( Br ) and Antimony ( Sb ) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall Tl's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion not to exceed 0,15 .
D. Falls within JEDEC MO-153

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 per end.
D Body width does not include interlead flash. Interlead flash shall not exceed 0.50 per side.
E. Falls within JEDEC MO-187 variation AA, except interlead flash.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to Tl's terms and conditions of sale supplied at the time of order acknowledgment.
TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with Tl's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.
TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.
TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from Tl under the patents or other intellectual property of TI .
Reproduction of Tl information in Tl data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated Tl product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify Tl and its representatives against any damages arising out of the use of Tl products in such safety-critical applications.
TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.
TI products are neither designed nor intended for use in automotive applications or environments unless the specific Tl products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
