Option 060 for Plastic Optocoupler

Data Sheet

Description

Optocouplers are frequently used to provide high voltage insulation. Because optocouplers perform this safety function, they are regulated by many country safety agencies, both at the component level and the equipment level.

Standard 8 Pin DIP optocouplers with Option 060, are tested according to IEC/EN/DIN EN60747-5-2 at VIORM = 630 Vpeak.

Surface Mount SO8 optocouplers with Option 060, are tested at VIORM = 560 Vpeak.

Avago Technologies also offers other various IEC/EN/DIN EN60747-5-2 approved products at different levels of VIORM such as VIORM = 1414 Vpeak

(HCNWxxxx series) and VIORM = 891 Vpeak (HCPL-Jxxx series).

Refer to the front of the optocoupler section of the Isolation and Control Component Designer's Catalog, under Product Safety Regulations section, for a detailed description of IEC/EN/DIN EN60747-5-2 and the partial discharge tests for production

Option 060 is available on the following products:

Parameter	Symbol	Value		Units	Conditions

Minimum External Air Gap (External Clearance)	L(101)	7.1	4.9	mm	Measured from input terminals to output terminals, shortest distance through air.
Minimum External Track ing (External Creepage)	- L(102)	7.4	4.8	mm	Measured from input terminals to output terminals, shortest distance path along body.
Minimum Internal Plastic Gap		0.08	0.08	mm	Through insulation distance, conductor to conductor, usually the direct distance between (Internal Clearance) the photoemitter and photodetector inside the optocoupler cavity.
Tracking Resistance (Comparative Tracking Index)	CTI	175	175	V	DIN IEC 112/VDE 0303 Part 1
Isolation Group		IIIa	IIIa		Material Group (DIN VDE 0110, 1/89, Table 1)

All Avago Technologies' data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered. There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.
