

32-Tap Digital Up/Down Control Potentiometer

FEATURES

- 32-position linear taper potentiometer
- Low power CMOS technology
- Single supply operation: 2.5V – 5.5V
- Discrete step-up/step-down digital control
- Resistance values: 10kΩ, 50kΩ and 100kΩ
- Available in SOT-23 8-lead Pb-free package

APPLICATIONS

- Automated product calibration
- Remote control adjustments
- Offset, gain and zero control
- Tamper-proof calibrations
- Contrast, brightness and volume controls
- Motor controls and feedback systems
- Programmable analog functions

For Ordering Information details, see page 7.

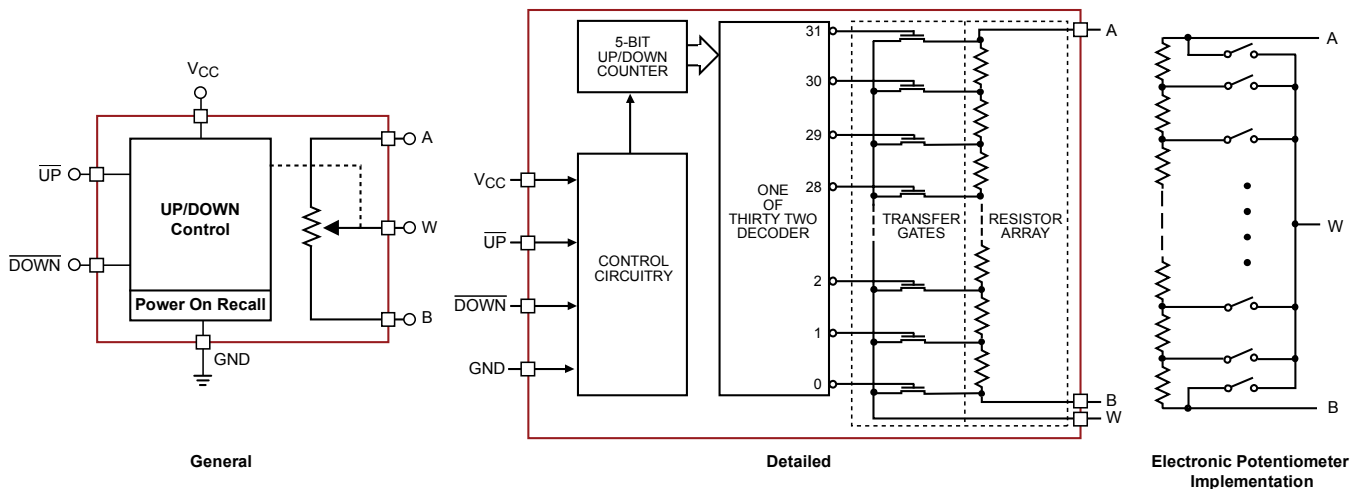

DESCRIPTION

The CAT5128 is a single digitally programmable potentiometer (DPP™) designed as an electronic replacement for mechanical potentiometers and trim pots. Ideal for automated adjustments on high volume production lines, they are also well suited for applications where equipment requiring periodic adjustment is either difficult to access or located in a hazardous or remote environment.

The CAT5128 contains a 32-tap series resistor array connected between two terminals A and B. An up/down counter and decoder that are controlled by two input pins, determines which tap is connected to the wiper, W. Wiper-control of the CAT5128 is accomplished with two input control pins, \overline{UP} and \overline{DOWN} . A high-to-low transition on the \overline{UP} input increments the wiper position and a high-to-low transition on the \overline{DOWN} input decrements the wiper position. The tap position is not stored in memory. The wiper is always set to the mid point, tap 15 at power up.

The digitally programmable potentiometer can be used as a three-terminal resistive divider or as a two-terminal variable resistor. DPPs bring variability and programmability to a wide variety of applications including control, parameter adjustments, and signal processing.

PIN CONFIGURATION

PIN DESCRIPTION

 \overline{UP} : Step-Up Control Input

When \overline{DOWN} input is high, a high-to-low transition on \overline{UP} input will cause the wiper to move one increment toward the A terminal.

 \overline{DOWN} : Step-Down Control Input

A high-to-low transition on \overline{DOWN} input will cause the wiper to move one increment towards the B terminal.

A: High End Potentiometer Terminal

A is the high end terminal of the potentiometer. It is not required that this terminal be connected to a potential greater than the B terminal. Voltage applied to the A terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

W: Wiper Potentiometer Terminal

W is the wiper terminal of the potentiometer. Its position on the resistor array is controlled by the control inputs, \overline{UP} and \overline{DOWN} . Voltage applied to the W terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND.

B: Low End Potentiometer Terminal

B is the low end terminal of the potentiometer. It is not required that this terminal be connected to a potential less than the A terminal. Voltage applied to the B terminal cannot exceed the supply voltage, V_{CC} or go below ground, GND. B and A are electrically interchangeable.

PIN DESCRIPTIONS

Name	Function
\overline{UP}	Step-Up Control
\overline{DOWN}	Step-Down Control
A	Potentiometer High Terminal
GND	Ground
W	Wiper Terminal
B	Potentiometer Low Terminal
NC	Not Connected
V_{CC}	Supply Voltage

DEVICE OPERATION

The CAT5128 operates like a digitally controlled potentiometer with A and B equivalent to the high and low terminals and W equivalent to the mechanical potentiometer's wiper. There are 32 available tap positions including the resistor end points, A and B. There are 31 resistor elements connected in series between the A and B terminals. The wiper terminal is connected to one of the 32 taps and controlled by two inputs, \overline{UP} and \overline{DOWN} . These inputs control a five-bit up/down counter whose output is decoded to select the wiper position.

A high-to-low transition on \overline{DOWN} input will decrement one step the wiper position (R_{WB} will decrease with 1LSB and R_{WA} will increase with 1LSB). If and only if \overline{DOWN} input is high, a high-to-low transition on \overline{UP} input will increment one step the wiper position (R_{WB} will increase with 1LSB and R_{WA} will decrease with 1LSB).

The wiper, when at either fixed terminal, acts like its mechanical equivalent and does not move beyond the last position. When the CAT5128 is powered-down, the wiper position is reset. When power is restored, the counter is set to the mid point, tap 15.

OPERATION MODES

\overline{UP}	\overline{DOWN}	Operation
High to Low	High	Wiper toward A – R_W Increment
X	Low	Wiper does not change
High	High to Low	Wiper toward B – R_W Decrement
High to Low	High to Low	Wiper toward B – R_W Decrement
Low	X	Wiper does not change
High	High	Wiper does not change
