

AD5024/AD5044/AD5064

FEATURES

- Low power quad 12-/14-/16-bit DAC, ± 1 LSB INL
- Pin compatible and performance upgrade to **AD5666**
- Individual and common voltage reference pin options
- Rail-to-rail operation
- 4.5 V to 5.5 V power supply
- Power-on reset to zero scale or midscale
- 3 power-down functions and per-channel power-down
- Hardware LDAC with software LDAC override function
- CLR function to programmable code
- SDO daisy-chaining option
- 14-/16-lead TSSOP
- Internal reference buffer and internal output amplifier

APPLICATIONS

- Process control
- Data acquisition systems
- Portable battery-powered instruments
- Digital gain and offset adjustment
- Programmable voltage and current sources
- Programmable attenuators

GENERAL DESCRIPTION

The AD5024/AD5044/AD5064/AD5064-1 are low power, quad 12-/14-/16-bit buffered voltage output nanoDAC[®] converters that offer relative accuracy specifications of 1 LSB INL and 1 LSB DNL with the AD5024/AD5044/AD5064 individual reference pin and the AD5064-1 common reference pin options. The AD5024/AD5044/AD5064/AD5064-1 can operate from a single 4.5 V to 5.5 V supply. The AD5024/AD5044/AD5064/AD5064-1 also offer a differential accuracy specification of ± 1 LSB. The parts use a versatile 3-wire, low power Schmitt trigger serial interface that operates at clock rates up to 50 MHz and is compatible with standard SPI, QSPI[™], MICROWIRE[™], and DSP interface standards. Integrated reference buffers and output amplifiers are also provided on-chip. The AD5024/AD5044/AD5064/AD5064-1 incorporate a power-on reset circuit that ensures the DAC output powers up to zero scale or midscale and remains there until a valid write takes place to the device. The AD5024/AD5044/AD5064/AD5064-1 contain a power-down feature that reduces the current consumption of the device to typically 400 nA at 5 V and provides software selectable output loads while in power-down mode. Total unadjusted error for the parts is < 2 mV.

Figure 2. AD5024/AD5044/AD5064 with Individual Reference Pins

PRODUCT HIGHLIGHTS

- Quad channel available in 14-/16-lead TSSOP packages.
- 16-bit accurate, 1 LSB INL.
- High speed serial interface with clock speeds up to 50 MHz.
- Reset to known output voltage (zero scale or midscale).

POWER REQUIREMENTS								
V _{DD}	4.5		5.5	4.5		5.5	V	DAC active, excludes load current
I _{DD} ¹⁰								V _{IH} = V _{DD} , V _{IL} = GND, Code = midscale
Normal Mode		4	6		4	6	mA	
All Power-Down Modes ¹¹		0.4	2		0.4	2	μA	T _A = -40°C to +105°C
			30			30	μA	T _A = -40°C to +125°C

¹ Temperature range is -40°C to +125°C, typical at 25°C.

² A grade offered in AD5064 only.

³ Linearity and total unadjusted error are calculated using a reduced code range—AD5064/AD5064-1: Code 512 to Code 65,024; AD5044: Code 128 to Code 16,256; AD5024: Code 32 to Code 4064. Output unloaded.

⁴ See the Terminology section.

⁵ Offset error calculated using a reduced code range—AD5064/AD5064-1: Code 512 to Code 65,024; AD5044: Code 128 to Code 16,256; AD5024: Code 32 to Code 4064. Output unloaded.

⁶ Guaranteed by design and characterization; not production tested.

⁷ Time to exit power-down mode to normal mode; 32nd clock edge to 90% of DAC midscale value, output unloaded.

⁸ Current flowing into individual digital pins. V_{DD} = 5.5 V; V_{REF} = 4.096 V; Code = midscale.

⁹ AD5064-1 only.

¹⁰ Interface inactive. All DACs active. DAC outputs unloaded.

¹¹ All four DACs powered down.

AC CHARACTERISTICS

V_{DD} = 4.5 V to 5.5 V, R_L = 5 kΩ to GND, C_L = 200 pF to GND, 2.5 V ≤ V_{REFIN} ≤ V_{DD}. All specifications T_{MIN} to T_{MAX}, unless otherwise noted.

Table 3.

Parameter ^{1,2}	Min	Typ	Max	Unit	Conditions/Comments ³
Output Voltage Settling Time		5.8	8	μs	¼ to ¾ scale and ¾ to ¼ scale settling to ±1 LSB, R _L = 5 kΩ, single-channel update
		10.7	13	μs	¼ to ¾ scale and ¾ to ¼ scale settling to ±1 LSB, R _L = 5 kΩ, all channel update
Slew Rate		1.5		V/μs	
Digital-to-Analog Glitch Impulse		3		nV-sec	1 LSB change around major carry
Reference Feedthrough		-90		dB	V _{REF} = 3 V ± 0.86 V p-p, frequency = 100 Hz to 100 kHz
Digital Feedthrough		0.1		nV-sec	
Digital Crosstalk		1.9		nV-sec	
Analog Crosstalk		2		nV-sec	
DAC-to-DAC Crosstalk		3.5		nV-sec	
AC Crosstalk		6		nV-sec	
Multiplying Bandwidth		340		kHz	V _{REF} = 3 V ± 0.86 V p-p
Total Harmonic Distortion		-80		dB	V _{REF} = 3 V ± 0.2 V p-p, frequency = 10 kHz
Output Noise Spectral Density		64		nV/√Hz	DAC code = 0x8400, frequency = 1 kHz
		60		nV/√Hz	DAC code = 0x8400, frequency = 10 kHz
Output Noise		6		μV p-p	0.1 Hz to 10 Hz

¹ Guaranteed by design and characterization; not production tested.

² See the Terminology section.

³ Temperature range is -40°C to +125°C, typical at 25°C.

TIMING CHARACTERISTICS

All input signals are specified with $t_R = t_F = 1 \text{ ns/V}$ (10% to 90% of V_{DD}) and timed from a voltage level of $(V_{IL} + V_{IH})/2$. See Figure 4 and Figure 5. $V_{DD} = 4.5 \text{ V}$ to 5.5 V . All specifications T_{MIN} to T_{MAX} , unless otherwise noted.

Table 4.

Parameter ¹	Symbol	Min	Typ	Max	Unit
SCLK Cycle Time	t_1	20			ns
SCLK High Time	t_2	10			ns
SCLK Low Time	t_3	10			ns
$\overline{\text{SYNC}}$ to SCLK Falling Edge Setup Time	t_4	17			ns
Data Setup Time	t_5	5			ns
Data Hold Time	t_6	5			ns
SCLK Falling Edge to $\overline{\text{SYNC}}$ Rising Edge	t_7	5		30	ns
Minimum $\overline{\text{SYNC}}$ High Time (Single Channel Update)	t_8	2			μs
Minimum $\overline{\text{SYNC}}$ High Time (All Channel Update)	t_8	8			μs
$\overline{\text{SYNC}}$ Rising Edge to SCLK Fall Ignore	t_9	17			ns
$\overline{\text{LDAC}}$ Pulse Width Low	t_{10}	20			ns
SCLK Falling Edge to $\overline{\text{LDAC}}$ Rising Edge	t_{11}	20			ns
$\overline{\text{CLR}}$ Minimum Pulse Width Low	t_{12}	10			ns
SCLK Falling Edge to $\overline{\text{LDAC}}$ Falling Edge	t_{13}	10			ns
$\overline{\text{CLR}}$ Pulse Activation Time	t_{14}	10.6			μs
SCLK Rising Edge to $\overline{\text{SDO}}$ Valid	$t_{15}^{2, 3}$			22	ns
SCLK Falling Edge to $\overline{\text{SYNC}}$ Rising Edge	t_{16}^2	5			ns
$\overline{\text{SYNC}}$ Rising Edge to SCLK Rising Edge	t_{17}^2	8			ns
$\overline{\text{SYNC}}$ Rising Edge to $\overline{\text{LDAC}}/\overline{\text{CLR}}/\overline{\text{PDL}}$ Falling Edge (Single Channel Update)	t_{18}^2	2			μs
$\overline{\text{SYNC}}$ Rising Edge to $\overline{\text{LDAC}}/\overline{\text{CLR}}/\overline{\text{PDL}}$ Falling Edge (All Channel Update)	t_{18}^2	8			μs
$\overline{\text{PDL}}$ Minimum Pulse Width Low	t_{19}	20			ns
Power-up Time ⁴		4.5			μs

¹ Maximum SCLK frequency is 50 MHz at $V_{DD} = 4.5 \text{ V}$ to 5.5 V . Guaranteed by design and characterization; not production tested.

² Daisy-chain mode only.

³ Measured with the load circuit of Figure 3. t_{15} determines the maximum SCLK frequency in daisy-chain mode. AD5064-1 only.

⁴ Time to exit power-down mode to normal mode of AD5024/AD5044/AD5064/AD5064-1, 32nd clock edge to 90% of DAC midscale value, with output unloaded.

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 5.

Parameter	Rating
V_{DD} to GND	-0.3 V to +7 V
Digital Input Voltage to GND	-0.3 V to $V_{DD} + 0.3$ V
V_{OUT} to GND	-0.3 V to $V_{DD} + 0.3$ V
V_{REF} to GND	-0.3 V to $V_{DD} + 0.3$ V
Operating Temperature Range	
Industrial	-40°C to +125°C
Storage Temperature Range	-65°C to +150°C
Junction Temperature ($T_{J\text{ MAX}}$)	150°C
TSSOP Package	
Power Dissipation	$(T_{J\text{ MAX}} - T_A)/\theta_{JA}$
θ_{JA} Thermal Impedance	113°C/W
Reflow Soldering Peak Temperature	
Pb-Free	260°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

Figure 6. 14-Lead TSSOP (RU-14)

Table 6. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	LDAC	LDAC can be operated in two modes, asynchronously and synchronously, as shown in Figure 4. Pulsing this pin low allows any or all DAC registers to be updated if the input registers have new data. This allows all DAC outputs to simultaneously update. This pin can also be tied permanently low in standalone mode. When daisy-chain mode is enabled, this pin cannot be tied permanently low; the LDAC pin should be used in asynchronous LDAC update mode, as shown in Figure 5, and the LDAC pin must be brought high after pulsing.
2	SYNC	Active Low Control Input. This is the frame synchronization signal for the input data. When SYNC goes low, it powers on the SCLK and DIN buffers and enables the shift register. Data is transferred in on the falling edges of the next 32 clocks. If SYNC is taken high before the 32 nd falling edge, the rising edge of SYNC acts as an interrupt and the write sequence is ignored by the device.
3	V _{DD}	Power Supply Input. These parts can be operated from 4.5 V to 5.5 V, and the supply should be decoupled with a 10 μF capacitor in parallel with a 0.1 μF capacitor to GND.
4	V _{OUTA}	Analog Output Voltage from DAC A. The output amplifier has rail-to-rail operation.
5	V _{OUTC}	Analog Output Voltage from DAC C. The output amplifier has rail-to-rail operation.
6	POR	Power-On Reset Pin. Tying this pin to GND powers up all four DACs to zero scale. Tying this pin to V _{DD} powers up all four DACs to midscale.
7	V _{REFIN}	This is a common pin for reference input for DAC A, DAC B, DAC C, and DAC D.
8	SDO	Serial Data Output. Can be used to daisy-chain a number of AD5064-1 devices together. The serial data is transferred on the rising edge of SCLK and is valid on the falling edge of the clock.
9	CLR	Asynchronous Clear Input. The CLR input is falling edge sensitive. When CLR is low, all LDAC pulses are ignored. When CLR is activated, the input register and the DAC register are updated with the data contained in the clear code register—zero, midscale, or full scale. Default setting clears the output to 0 V.
10	V _{OUTD}	Analog Output Voltage from DAC D. The output amplifier has rail-to-rail operation.
11	V _{OUTB}	Analog Output Voltage from DAC B. The output amplifier has rail-to-rail operation.
12	GND	Ground Reference Point for All Circuitry on the Part.
13	DIN	Serial Data Input. This device has a 32-bit shift register. Data is clocked into the shift register on the falling edge of the serial clock input.
14	SCLK	Serial Clock Input. Data is clocked into the shift register on the falling edge of the serial clock input. Data can be transferred at rates of up to 50 MHz.

Figure 7. 16-Lead TSSOP (RU-16) Pin Configuration

Table 7. Pin Function Descriptions

Pin No.	Mnemonic	Description
1	LDAC	LDAC can be operated in two modes, asynchronously and synchronously, as shown in Figure 4. Pulsing this pin low allows any or all DAC registers to be updated if the input registers have new data. This allows all DAC outputs to simultaneously update. This pin can also be tied permanently low in standalone mode.
2	SYNC	Active Low Control Input. This is the frame synchronization signal for the input data. When SYNC goes low, it powers on the SCLK and DIN buffers and enables the shift register. Data is transferred in on the falling edges of the next 32 clocks. If SYNC is taken high before the 32 nd falling edge, the rising edge of SYNC acts as an interrupt and the write sequence is ignored by the device.
3	V _{DD}	Power Supply Input. These parts can be operated from 4.5 V to 5.5 V, and the supply should be decoupled with a 10 μF capacitor in parallel with a 0.1 μF capacitor to GND.
4	V _{REFB}	DAC B Reference Input. This is the reference voltage input pin for DAC B.
5	V _{REFA}	DAC A Reference Input. This is the reference voltage input pin for DAC A.
6	V _{OUTA}	Analog Output Voltage from DAC A. The output amplifier has rail-to-rail operation.
7	V _{OUTC}	Analog Output Voltage from DAC C. The output amplifier has rail-to-rail operation.
8	POR	Power-On Reset. Tying this pin to GND powers up the part to 0 V. Tying this pin to V _{DD} powers up the part to midscale.
9	V _{REFC}	DAC C Reference Input. This is the reference voltage input pin for DAC C.
10	CLR	Asynchronous Clear Input. The CLR input is falling edge sensitive. When CLR is low, all LDAC pulses are ignored. When CLR is activated, the input register and the DAC register are updated with the data contained in the clear code register—zero, midscale, or full scale. Default setting clears the output to 0 V.
11	V _{REFD}	DAC D Reference Input. This is the reference voltage input pin for DAC D.
12	V _{OUTD}	Analog Output Voltage from DAC D. The output amplifier has rail-to-rail operation.
13	V _{OUTB}	Analog Output Voltage from DAC B. The output amplifier has rail-to-rail operation.
14	GND	Ground Reference Point for All Circuitry on the Part.
15	DIN	Serial Data Input. This device has a 32-bit shift register. Data is clocked into the shift register on the falling edge of the serial clock input.
16	SCLK	Serial Clock Input. Data is clocked into the shift register on the falling edge of the serial clock input. Data can be transferred at rates of up to 50 MHz.
