

## MAX44242

## 20V, Low Input Bias-Current, Low-Noise, Dual Op Amplifier

### General Description

The MAX44242 provides a combination of high voltage, low noise, low input bias current in a dual channel and features rail-to-rail at the output.

This dual amplifier operates over a wide supply voltage range from a single 2.7V to 20V supply or split  $\pm 1.35V$  to  $\pm 10V$  supplies and consumes only 1.2mA quiescent supply current per channel.

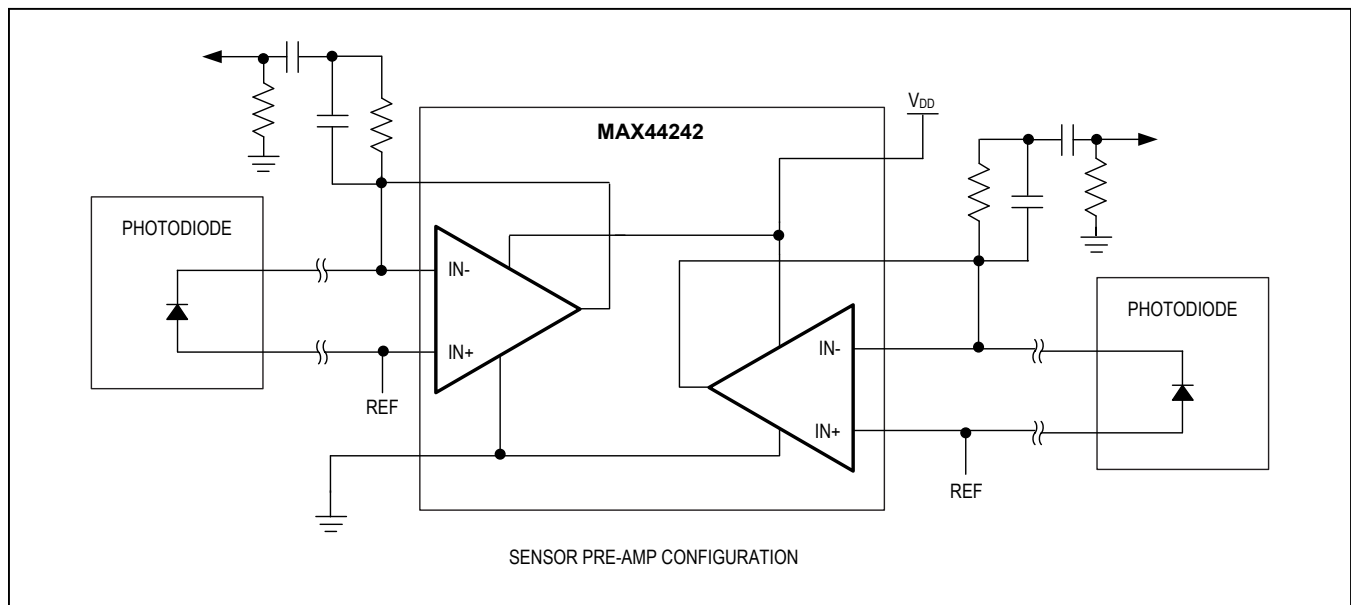

The MAX44242 is a unity-gain stable amplifier with a gain-bandwidth product of 10MHz. The device outputs drive up to 200pF load capacitor without any external isolation resistor compensation.

The MAX44242 is available in 8-pin SOT23 and  $\mu\text{MAX}^{\text{®}}$  packages and is rated for operation over the  $-40^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$  automotive temperature range.

### Applications

- Chemical Sensor Interface
- Photodiode Sensor Interface
- Medical Pulse Oximetry
- Industrial: Process and Control
- Precision Instrumentation

### Typical Application Circuit

### Features and Benefits

- 2.7V to 20V Single Supply or  $\pm 1.35V$  to  $\pm 10V$  Dual Supplies
- 0.5pA (max) Input Bias Current
- $5\text{nV}/\sqrt{\text{Hz}}$  Input Voltage Noise
- 10MHz Bandwidth
- $8\text{V}/\mu\text{s}$  Slew Rate
- Rail-to-Rail Output
- Integrated EMI Filters
- 1.2mA Supply Current per Amplifier

**Ordering Information** appears at end of data sheet.

$\mu\text{MAX}$  is a registered trademark of Maxim Integrated Products, Inc.

**Absolute Maximum Ratings**

Supply Voltage (V <sub>DD</sub> to V <sub>SS</sub> )	-0.3V to +22V	Operating Temperature Range	-40°C to +125°C
All Other Pins	(V <sub>SS</sub> - 0.3V) to (V <sub>DD</sub> + 0.3V)	Junction Temperature	+150°C
Short-Circuit Duration to V <sub>DD</sub> or V <sub>SS</sub>	1s	Storage Temperature Range	-65°C to +150°C
Continuous Input Current (Any Pins)	±20mA	Lead Temperature (soldering, 10s)	+300°C
Differential Input Voltage	±6V		
Continuous Power Dissipation (T <sub>A</sub> = +70°C)			
8-Pin SOT23 (derate 5.1mW/°C above +70°C)	408.2mW		
8-Pin μMAX (derate 4.5mW/°C above +70°C)	362mW		

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Package Thermal Characteristics (Note 1)**

SOT23	Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> )	196°C/W	μMAX	Junction-to-Ambient Thermal Resistance (θ <sub>JA</sub> )	221°C/W
	Junction-to-Case Thermal Resistance (θ <sub>JC</sub> )	70°C/W		Junction-to-Case Thermal Resistance (θ <sub>JC</sub> )	42°C/W

**Note 1:** Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](http://www.maximintegrated.com/thermal-tutorial).

**Electrical Characteristics**

(V<sub>DD</sub> = 10V, V<sub>SS</sub> = 0V, V<sub>IN+</sub> = V<sub>IN-</sub> = V<sub>DD</sub>/2, R<sub>L</sub> = 10kΩ to V<sub>DD</sub>/2, T<sub>A</sub> = -40°C to +125°C, unless otherwise noted. Typical values are at T<sub>A</sub> = +25°C.) (Note 2)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS

**Note 2:** All devices are production tested at  $T_A = +25^\circ C$ . Specifications over temperature are guaranteed by design.

**Note 3:** Guaranteed by design.

Typical Operating Characteristics

( $V_{DD} = 10V$ ,  $V_{SS} = 0V$ , outputs have  $R_L = 10k\Omega$  to  $V_{DD}/2$ .  $T_A = +25^\circ C$ , unless otherwise specified.)

Typical Operating Characteristics (continued)

( $V_{DD} = 10V$ ,  $V_{SS} = 0V$ , outputs have  $R_L = 10k\Omega$  to  $V_{DD}/2$ .  $T_A = +25^\circ C$ , unless otherwise specified.)

Typical Operating Characteristics (continued)

( $V_{DD} = 10V$ ,  $V_{SS} = 0V$ , outputs have  $R_L = 10k\Omega$  to  $V_{DD}/2$ .  $T_A = +25^\circ C$ , unless otherwise specified.)

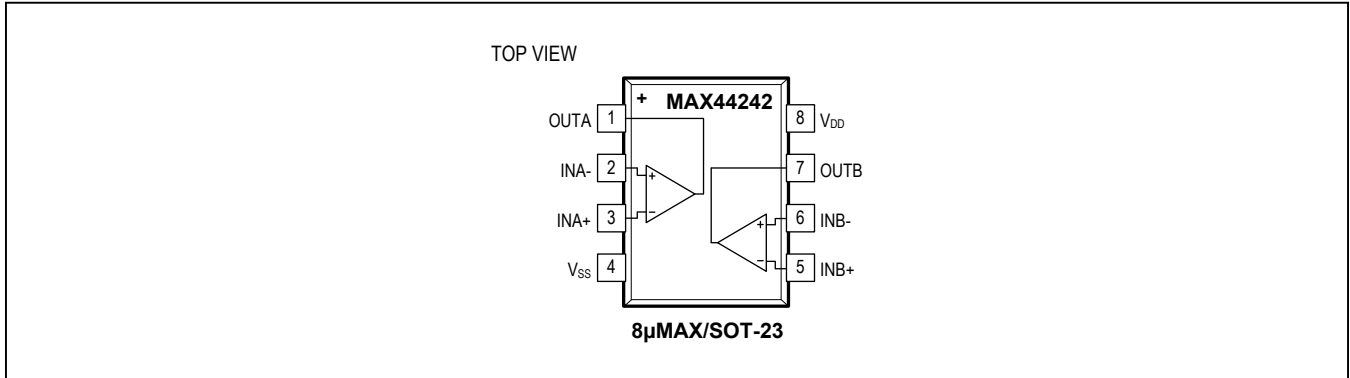

Typical Operating Characteristics (continued)

( $V_{DD} = 10V$ ,  $V_{SS} = 0V$ , outputs have  $R_L = 10k\Omega$  to  $V_{DD}/2$ .  $T_A = +25^\circ C$ , unless otherwise specified.)

Pin Configuration

Pin Description

PIN	NAME	FUNCTION
1	OUTA	Channel A Output
2	INA-	Channel A Negative Input
3	INA+	Channel A Positive Input
4	V <sub>SS</sub>	Negative Supply Voltage. Connect V <sub>SS</sub> to ground if single supply is used.
5	INB+	Channel B Positive Input
6	INB-	Channel B Negative Input
7	OUTB	Channel B Output
8	V <sub>DD</sub>	Positive Supply Voltage

Detailed Description

Combining high input impedance, low input bias current, wide bandwidth, and fast settling time, the MAX44242 is an ideal amplifier for driving precision analog-to-digital inputs and buffering digital-to-analog converter outputs.

Input Bias Current

The MAX44242 features a high-impedance CMOS input stage and a special ESD structure that allows low input bias current operation at low-input, common-mode voltages. Low input bias current is useful when interfacing with high-ohmic or capacitive sensors and is beneficial for designing transimpedance amplifiers for photodiode sensors. This makes the device ideal for ground-referenced medical and industrial sensor applications.

Integrated EMI Filter

Electromagnetic interference (EMI) noise occurs at higher frequency that results in malfunction or degradation of electrical equipment.

The MAX44242 has an input EMI filter to avoid the output from getting affected by radio frequency interference. The EMI filter, composed of passive devices, presents significant higher impedance to higher frequencies.

High Supply Voltage Range

The device features 1.2mA current consumption per channel and a voltage supply range from either 2.7V to 20V single supply or ±1.35V to ±10V split supply.

**Typical Application Circuit**

**High-Impedance Sensor Application**

High impedance sources like pH sensor, photodiodes in applications require negligible input leakage currents to the input transimpedance/buffer structure. The MAX44242 benefits with clean and precise signal conditioning due to its input structure.

The device interfaces to both current-output sensors (photodiodes) (Figure 1), and high-impedance voltage sources (piezoelectric sensors). For current output sensors, a transimpedance amplifier is the most noise-efficient method for converting the input signal to a voltage. High-value feedback resistors are commonly chosen to create large gains, while feedback capacitors help stabilize the amplifier by cancelling any poles introduced in the feedback loop by the highly capacitive sensor or cabling. A combination of low-current noise and low-voltage noise is important for these applications. Take care to calibrate out photodiode dark current if DC accuracy is important. The high bandwidth and slew rate also allow AC signal processing in certain medical photodiode sensor applications such as pulse-oximetry. For voltage-output sensors, a noninverting amplifier is typically used to buffer and/or

apply a small gain to the input voltage signal. Due to the extremely high impedance of the sensor output, a low input bias current with minimal temperature variation is very important for these applications.

**Transimpedance Amplifier**

As shown in Figure 2, the noninverting pin is biased at 2V with C2 added to bypass high-frequency noise. This bias voltage to reverse biases the photodiode D1 at 2V which is often enough to minimize the capacitance across the junction. Hence, the reverse current ( $I_R$ ) produced by the photodiode as light photons are incident on it, a proportional voltage is produced at the output of the amplifier by the given relation:

$$V_{OUT} = I_R \times R1$$

The addition of C1 is to compensate for the instability caused due to the additional capacitance at the input (junction capacitance  $C_j$  and input capacitance of the op amp  $C_{IN}$ ), which results in loss of phase margin. More information about stabilizing the transimpedance amplifier can be found in [Application Note 5129: Stabilize Your Transimpedance Amplifier](#).
